

Estadística Aplicada, Pág 227

① $M_0 = 680 \text{ g}$ $\alpha =$

$n = 50$

$M = 684,2 \text{ g}$

$S = 12,1 \text{ g}$

a) $\alpha = 5\%$

1) Hipótesis

$H_0: M = 680 \text{ g}$

$H_1: M \neq 680 \text{ g}$

2) $z_{\text{crítico}} \Rightarrow z_{\frac{\alpha}{2}} \Rightarrow \frac{0,05}{2} = 0,025 \Rightarrow 0,475$

$z_{\text{crítico}} = \pm 1,96$

3) $z_{\text{teste}} = \frac{684,2 - 680}{\frac{12,1}{\sqrt{50}}} = 2,45$

\therefore Rejeitar H_0

A média é diferente de $684,2 \text{ g}$

b) $\alpha = 1\%$

2) $z_{\text{crítico}} \Rightarrow z_{\frac{\alpha}{2}} \Rightarrow \frac{0,01}{2} = 0,005 \Rightarrow 0,495$

$z_{\frac{\alpha}{2}} = 2,58$
